

UNCRACKABLE WEBSITES

We use proprietary techniques and technologies to protect websites from cracking attacks.

Our techniques are more secure than those used by .mil sites.

These techniques have been in development almost since the days the HTTP protocol was invented.

Services offered :

Creation of secure and uncrackable websites.

Upgrading of existing websites to be made uncrackable.

In case you are wondering why we are not using the word hacking for cracking. Here are the technical definitions for the two words which are not commonly known these days.

Cracker :

A cracker is an individual who attempts to access computer systems without authorization. These individuals are often malicious, as opposed to hackers, and have many means at their disposal for breaking into a system. See also: hacker, Computer Emergency Response Team, Trojan Horse, virus, worm.

Hacker :

A person who delights in having an intimate understanding of the internal workings of a system, computers and computer networks in particular. The term is often misused in a pejorative context, where "cracker" would be the correct term. See also: cracker.
