

Global Warming is a lie.

Here is the proof along with reasons for the lies.

By : Khawar Nehal

Date : 17 December 2016

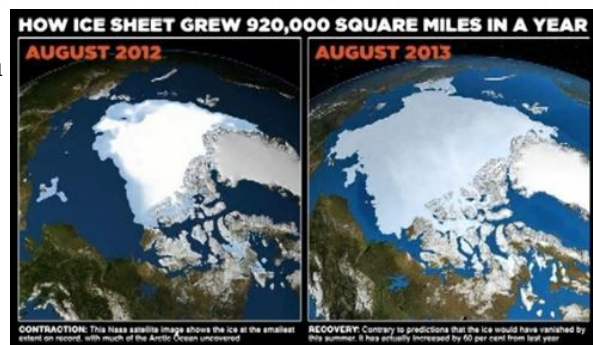

Have a look that the temperature graph.

What you have been presented is a hoax. The data has been selectively picked from a larger variation trend which has nothing to do with the correlation to what it is hyped.

What some people say is that it is humans and their CO₂ and Methane related activities cause it.

One look at the data shall raise the question, what caused the rise between the year 500 to 1000. Also so obvious why is it fluctuating so much. Also why was the last part of the graph selected to misrepresent an idea.

Here is the new theory for you.

Someone does not want you to use Coal, Natural Gas and Fossil fuels for your business.

Since the scientists (those who see both sides) can see that the data says there is no global warming. It is just a bunch of politicians claiming that “scientists” say that global warming is happening.

There is no global warming to deny. It never existed except as misinformation. The majority of the world never bothered to look at both sides.

Why was the one sided presentation made ? This is a good question which should have arisen.

Here is an explanation. I shall not say maybe because the people pushing the lies are so blatant at making them. **I shall blatantly call them liars and present their reasons to do so.**

The reason the rich countries want to keep pushing the lie includes the following reasons :

1. Getting “other” countries to “think” about using less of their low cost fuel. (Coal, Gas, Oil)
2. Keep selling the low cost fuel to rich countries.
3. The rich countries keep using the low cost energy to boost their economies and keep pushing the kind hearted nice (generally poor) and harder working countries into a weaker economic and political position.

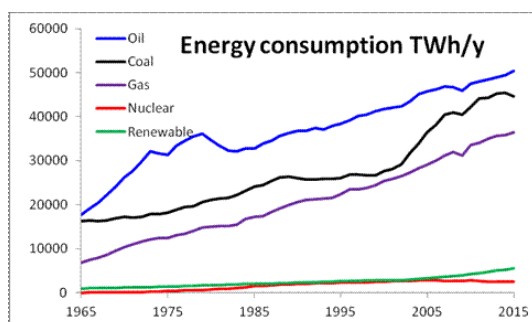

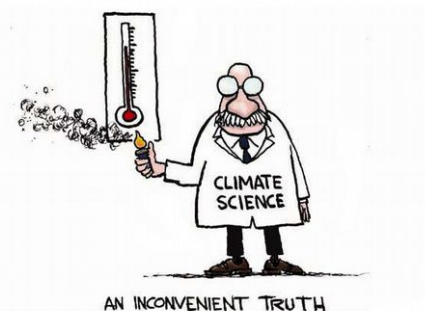

How can this be true :

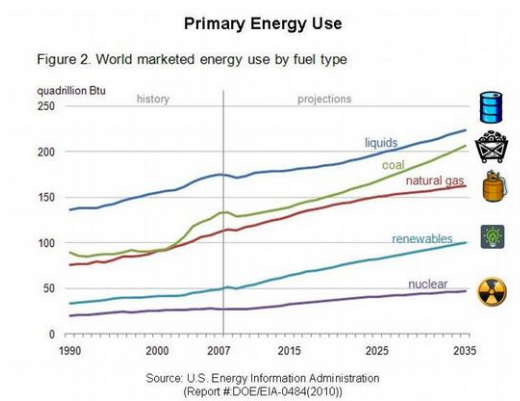

1. Look at the real temperature graph above. It is called weather.

2. Coal, Gas and Oil are going to be used because they cost less and the economics wins over the politics.

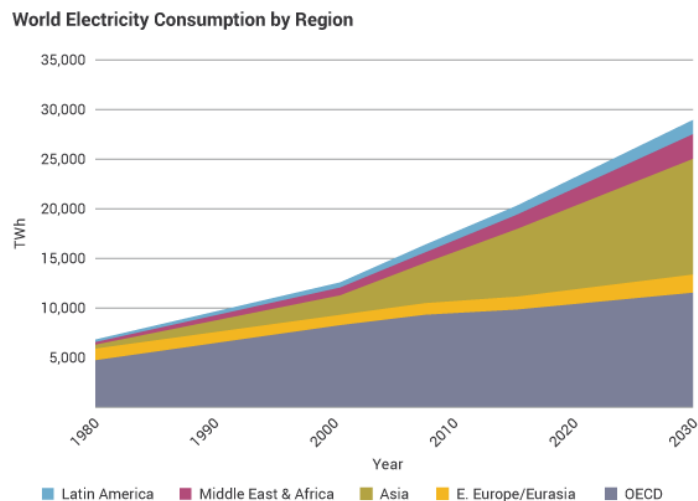

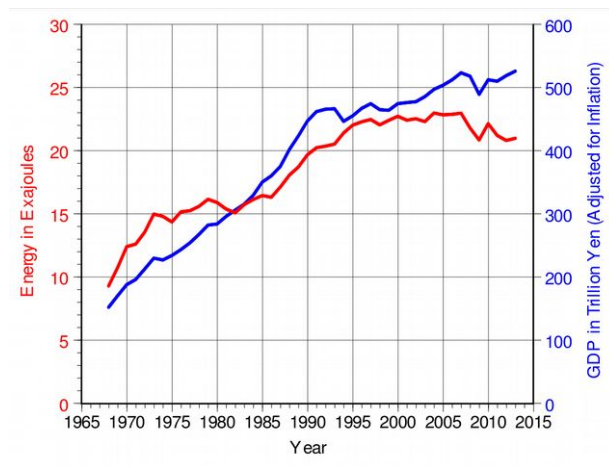

Only those countries lose who decide to invest their resources into using more expensive energy.

3. Future. All the hype shall not change the current trend of cost and usage.

4. A country's economy has a very HIGH correlation with energy use.

Source: OECD/IEA World Energy Outlook 2009 - Reference Scenario

5. It does not matter if you care or do not care about reality. The fact remains, that as soon as serious decision makers (the movers and shakers) realize the reality that Coal, Oil and Gas are here to stay and the only thing they can do is go with the trend or lose a part of their economy, they may decide to choose economy over hype.

6. Another reason this is true. My personal business includes alternative energy like solar and wind power. It is in my “personal” interest to promote alternative to oil, but since I also teach all types of energy generation. I do not have any Oil, Gas or coal projects to make money from.

It does me more harm “personally” to not promote my money making incentives of alternative energy which I sell solutions for making money. But the reason to explain to you all the reality is that Oil, gas and coal power generation where available (near large cities) has a cost advantage which is not going to be beaten easily for the majority of cases. Solar can be advantageous in remote areas and in some cases in urban areas. But as long as the cost of coal powered energy is low, we can expect the hidden agenda not so nice rich countries pushing for this global warming lies while continuing to increase their use of Gas, Coal and Oil as much as possible.
